ABSTRACTED-PUB-NO: JP08012699A

BASIC-ABSTRACT:

Avidin modified by PEG is new.

Also claimed is a method for the sepn. or the determ. of an antigen or an antibody contained in a sample by using a complex in which biotin is combined to an antigen or an antibody and avidin modified by PEG is combined in it.

ADVANTAGE - The complex is PEG-soluble and a complex prepd. from an antigen protein is also PEG-soluble. It may be easily sepd. and detected.

In an example, specific egg white-originated avidin was dissolved in 0.3 M borate buffer to 1 mg/ml. An amt. of activated 2,4-bis-(O-methoxy polyethylene glycol)-6-chloro-S-triazine was added to it and the mixt. was adjusted to pH 7.0 with 1 N NaOH and reacted at 40 deg.C for 1.5 hr. It was ultrafiltered and centrifuged at 4 deg.C for 10 min. to give PEG-modified avidin. The biotin-combining activity was determined by using HABA. To investigate if the PEG-modified avidin maintains high affinity to a biotinated enzyme, the PEG-modified avidin was combined to biotinated peroxidase in a molar ratio of 1:1 and the affinity was examined by gel chromatography using Sephadex G-50. The PEG-modified avidin reacted quantitatively with the biotinated peroxidase. The behaviour of the PEG-modified avidin and unmodified avidin in an aq. two-phase system of dextran/PEG was examined. The former was transferred quantitatively to the PEG phase, while the latter was not transferred.
